Article title: Genomic structure and ex situ conservation of the North American grapevine *Vitis labrusca*

Authors: Zoë Migicovsky, Clay Elzinga, Mia C. Lauzon, Thomas Connor, Kylie DeViller, Claire Dinn, Grace M. Earle, Emma Hockley, Olivia Lennon, Lillian A. Ricker, Peter M. Roberts, Katrina M. Robinson, Aditi Sharma, Paris N. Spencer, Sammy Stockdale, Liam L. Tingley, Annelies Yates, Jason P. Londo, Peter Cousins

The following Supporting Information is available for this article:

Figure S1. Principal components analysis (PCA) of genomic variation for *Vitis labrusca* both conserved and wild-collected, prior to removal of putative hybrids (n = 271).

Figure S2. Population structure of *Vitis labrusca* (n = 183) from accessions conserved in the USDA conserved germplasm collection (A) and wild collected (B), after removing putative hybrids using fastSTRUCTURE (K=2).

Dataset S1. Accession information and results table for all *Vitis labrusca* (n = 271) sequenced in this study (see Excel file).

Figure S1. Principal components analysis (PCA) of genomic variation for *Vitis labrusca* both conserved and wild-collected, prior to removal of putative hybrids (n = 271). (A) A genomic PCA shows variation in accessions labelled by shape for source (conserved or wild) and coloured by origin (state or unknown). Percent variance explained by each principal component (PC) is reported in parentheses. Boxplots of (B) PC1 values and (C) PC2 values are plotted based on source and origin.

Figure S2. Population structure of *Vitis labrusca* (n = 183) from accessions conserved in the USDA conserved germplasm collection (A) and wild collected (B), after removing putative hybrids using fastSTRUCTURE (K=2). Ancestry proportions for each accession are indicated based on vertical bars, with three inferred clusters labelled by colour. Accessions are grouped within source (panel) based on the state of origin, with the state colour-coded beneath the plot. States are ordered alphabetically
